WFIT
GYM MANAGEMENT CRM

Software Requirements & Workflow Specification

A practical brief for designing and developing a reliable gym operations platform.

Primary objective

Create one centralized system to manage enquiries, memberships, billing, collections, renewals, biometric access, attendance, personal training and business reporting.

Priority requirement

The management dashboard must clearly show Total Sales, Today's Sales, Pending Payments / Outstanding Dues, along with membership sales, PT sales, renewals, lead conversion and attendance.

Prepared as an initial scope document. The development team should confirm feasibility, integrations, project cost, timeline and acceptance criteria before implementation.

1. Project Scope

Build a secure, responsive web-based CRM that works on desktop, tablet and mobile. The system should support a single branch initially and be designed so additional branches can be added without rebuilding the core platform.

Core modules

- Member registration and complete client profile with photo capture.
- Membership plans, renewals, invoices, receipts and payment tracking.
- Lead / enquiry CRM with assigned staff and scheduled follow-ups.
- Automated renewal reminders before expiry.
- Biometric access-control integration and attendance logs.
- Personal training (PT) packages, sessions, trainer assignments and commission rules.
- Management dashboard, financial reports, staff permissions and audit history.

2. Dashboard — Mandatory Requirements

The dashboard should be available to the owner and authorized managers. Figures must update from actual transactions and should be filterable by date range and branch where applicable.

Dashboard metric	Required definition / behaviour
Total Sales	Total sales for the selected period, with separate membership and PT sales. Show gross sales, discounts, refunds and net sales where appropriate.
Today's Sales	Sales recorded today, with a clear breakdown by membership, PT, registration fees and other services.
Payments Collected Today	Money actually received today, separated from sales booked today.
Pending Payments / Outstanding Dues	Total unpaid balance across invoices, including member-wise amount due, due date and follow-up status.
MTD Sales	Month-to-date sales, compared with the previous month or target if configured.
Active Members	Count of members with currently valid memberships.
New Memberships	Memberships sold in the selected period.
Renewals Due	Members expiring in 7 days / 30 days, overdue renewals and renewal conversion rate.
Leads & Conversion	New leads, follow-ups due today, overdue follow-ups, visits, conversions and lost leads.
Attendance	Today's check-ins, unique members checked in, peak periods and device sync status.
PT Sales & Sessions	PT sales, active PT clients, sessions completed and remaining sessions.
Payment Mode Summary	Cash, UPI/GPay, card, bank transfer and gateway totals for reconciliation.

Critical reporting rule: Sales, payments collected and outstanding balances are different metrics. Do not display them as interchangeable figures. The dashboard must support date filters and drill-down to the underlying invoices/transactions.

3. Member Registration & Profile

Each person must have one unique Member ID and one persistent profile. Renewals should create new membership records under the same member rather than duplicate the person.

Required fields

- Full name, mobile number, optional email and date of birth.
- Client photo captured from camera or uploaded by authorized staff.
- Member ID, registration date, branch and profile status.
- Membership plan, start date, end / expiry date and current status.
- Emergency contact if needed; consent records where applicable.
- Membership history, invoices, payments, attendance, renewals and relevant notes.
- Biometric enrollment status and device/member mapping; do not expose raw biometric data in the ordinary profile.

4. Membership Plans & Billing

Management must be able to create and edit plan names, duration, price, registration fee, offers and applicable tax settings without developer intervention. Example reference prices below are illustrative and must remain editable.

Plan	Example price
1 month	■2,999
3 months	■6,999
6 months	■9,999
12 months	■13,999

Billing capabilities

- Automatically generated unique invoice number and PDF invoice / receipt.
- Record cash, UPI/GPay, card, bank transfer and online gateway payments.
- Support full payments, partial payments, unpaid balances and payment allocation.
- Record discounts, registration fees, offers, refunds, cancellations and credit notes with approvals.
- Show original price, discount, final payable, amount paid and balance separately.
- Daily collection, MTD collection, payment-mode summary and reconciliation report.
- Configurable tax treatment based on applicable rules; do not hard-code tax by payment method.
- Restrict financial actions by role and maintain an audit log of changes.

5. Renewal Automation

A backend scheduler must check expiry dates every day. Reminders must not depend on a staff member opening the CRM.

Timing	Action
7 days before expiry	Send first renewal reminder and create / update follow-up task.
3 days before expiry	Send reminder if the membership has not been renewed.
1 day before expiry	Send final pre-expiry reminder and alert assigned front-office staff.
On expiry	Mark membership expired if not renewed and apply the configured access policy.
After expiry	Show the member in overdue renewal follow-up; continue only according to the configured policy.

System controls: prevent duplicate reminders; record message status (queued, sent, delivered if supported, failed); retry safely; use approved WhatsApp Business / SMS integrations; respect consent and opt-out preferences. Reminders do not mean automatic payment collection. Recurring payment requires an authorized payment setup.

Renewal dashboard filters: expires in 7 days, expires in 30 days, reminders sent, renewal completed, expired members, overdue follow-ups and staff-wise conversion.

6. Enquiry & Lead Management

Capture leads from walk-ins, calls, website forms, Instagram, WhatsApp, referrals and other configurable sources. Each lead must have an owner and a next action.

Pipeline stage	System behaviour
New enquiry	Capture name, mobile, source, enquiry date and interest.
Contacted	Record call/message outcome, notes and next follow-up.
Visit / trial scheduled	Store appointment date/time and assigned staff.
Visited / trial completed	Record feedback, package interest and next step.
Follow-up pending / overdue	Show due tasks on staff dashboard and escalate overdue tasks.
Converted	Create membership from lead data, retain history and prevent duplicate profiles.
Lost	Record reason and date; allow reporting by source and staff.

Lead fields

- Name and mobile number; email only if provided.
- Enquiry source, interested product (membership, PT, boxing or group classes), assigned executive and status.
- Last contact, next follow-up date/time, notes, visit/trial status and conversion value.
- Search by mobile number to reduce duplicate leads and member profiles.
- Daily list of follow-ups due, overdue follow-ups, new leads and conversions.

7. Biometric Access & Attendance

Integrate with a compatible fingerprint or face-access device only after confirming the exact hardware model, vendor SDK/API, controller, network requirements and licensing. Not every biometric device can integrate with every CRM.

- Enroll the member on the supported device and map the device credential to the unique Member ID.
- On scan, validate membership status and configured access rules; allow or deny entry.
- Log Member ID, timestamp, device, result and reason for denial where available.
- Avoid duplicate attendance entries from repeated scans within a configurable time window.
- Support device health / last-sync status and safe synchronization after offline periods.
- Define an authorized manual override process with staff ID, reason and timestamp.
- Configure policies for expired, suspended, blocked and unpaid members.
- Provide an alternative check-in process for device failure or members unable to use the chosen biometric method.

Privacy and security: prefer protected biometric templates managed by a suitable device/vendor rather than storing raw fingerprint images. Implement consent, least-privilege access, retention controls, encryption and applicable Indian data-protection requirements.

8. Personal Training (PT) Management

- Configurable PT packages, pricing, duration, start date and expiry date.
- Assign trainer(s) to clients and track purchased, completed, cancelled and remaining sessions.
- PT invoice, payments, balance and renewal reminders separate from gym membership.
- Trainer-wise active clients, PT sales and sessions completed.
- Configurable trainer commission rules approved by management, with a transparent calculation report.
- Optional client assessment and progress records, with restricted access to sensitive information.

9. User Roles & Permissions

Role	Access scope
Owner / Admin	All branches, settings, reports, users, approvals and audit logs.
Club Manager	Operational dashboard, team performance, approvals and assigned branch.
Front Office	Member registration, leads, billing and renewal follow-up; financial actions limited by permission.
Accounts	Payments, reconciliation, refunds / credit notes and financial reports.
Trainer	Assigned clients, PT sessions and permitted progress details.
Member (optional portal)	Own membership, receipts, attendance and renewal information only.

High-risk actions—discount overrides, refunds, invoice edits, expiry changes and manual access overrides—must be permission-controlled and logged.

10. Reports & Analytics

- Daily, weekly, monthly and custom-period sales and collection reports.
- Sales by membership, PT, registration fee, product/service and branch.
- Payment-mode reconciliation, outstanding dues, refunds and discounts.
- Active, new, renewed, expired and suspended member counts.
- Renewal performance and staff-wise renewal conversion.
- Lead source performance, lead conversion, lost reasons and staff follow-up completion.
- Attendance trends, unique daily visitors and device sync issues.
- Trainer-wise PT sales, sessions and commission report.
- Optional expenses and estimated operating profit, clearly separated from cash collection.

11. Technical & Security Requirements

- Responsive web application for desktop, tablet and mobile; member app can be a later phase.
- Secure authentication, role-based access, password/session controls and audit logging.
- Relational database such as PostgreSQL; documented schema and API.
- Protected storage for photos and documents with restricted access.
- Backend scheduler for expiry checks and reminders; idempotent jobs to avoid duplicates.
- Reliable backup, restore testing, monitoring, error logs and disaster-recovery plan.
- Data export for authorized users and clear data ownership / handover terms.
- Support for future branches, configurable branch-level access and consolidated reporting.
- Documented integration boundaries for messaging, payment gateway and biometric device.

12. Recommended Development Phases

Phase	Scope
1 — Core CRM	Member profiles/photos, plans, membership records, invoices, payments, leads and basic dashboard.
2 — Automation	7 / 3 / 1-day reminders, overdue tasks, expiry processing and notification logs.
3 — Biometric	Hardware validation, access rules, attendance integration and offline handling.
4 — Advanced	PT commissions, multi-branch reports, member portal, accounting integrations and advanced analytics.

This phasing is a recommendation, not a fixed promise. The development team should quote each phase and identify dependencies before work begins.

13. Acceptance Tests — Required Before Launch

The team must demonstrate these scenarios in a test environment before the system is accepted:

1. Create a new member with photo and unique Member ID; reject or flag a duplicate mobile/profile.
2. Sell a membership, generate an invoice and receipt, and verify price, discount, payment and balance.
3. Record a partial payment and confirm the unpaid amount appears in Pending Payments / Outstanding Dues.
4. Verify Total Sales, Today's Sales, Payments Collected Today and MTD Sales use the correct definitions and date filters.
5. Run renewal reminder tests at 7, 3 and 1 day before expiry, including duplicate prevention and failed-message handling.
6. Expire a membership and verify the configured biometric access decision and attendance log.
7. Simulate a device or network outage and verify the documented fallback and synchronization process.
8. Create a lead, schedule a follow-up, mark it overdue, convert it and retain its history.
9. Record PT sessions and verify remaining sessions, expiry and commission calculation.
10. Test permissions, audit logs, backup restoration and export of authorized records.

14. Questions the Development Team Must Confirm

- Which biometric device models are supported, and is integration included in the quoted price?
- Which WhatsApp/SMS provider will be used, and what are its setup, template and per-message costs?
- Is an online payment gateway required, or will staff record payments manually?
- Are GST invoices, credit notes, refunds and accounting exports included? Confirm the applicable tax configuration with the business/accountant.
- Is the quote for one branch or multi-branch, and what are the hosting, backup and maintenance charges?
- Who owns the source code, database, domain, cloud account and exported data?
- What is the delivery timeline, milestone/payment schedule, bug-fix period, support SLA and training plan?
- What happens to data and service access if the contract ends or the vendor changes?

15. Commercial Deliverables Expected

- Written scope and exclusions, screen-by-screen workflow and UI prototype.
- Project timeline, itemized quote, third-party costs and recurring fees.
- Database/API documentation, deployment notes and administrator guide.
- Testing evidence, staff training and handover checklist.
- Backup and recovery procedure, support contact and maintenance terms.

Final note: Prioritize accurate billing, reliable renewal automation, correct outstanding balances and verified biometric compatibility over cosmetic dashboard features. These are the operational foundations of the system.

Document status: Initial requirements for discussion and estimation. Final scope should be approved jointly by the gym owner and development team.
